

CTI Clinical Trial and Consulting Services named "Best Places to Work" in Greater Cincinnati for Second Consecutive Year

CTI adds Oracle's Siebel CTMS System to Enhance Trial Efficiencies

Clinical trials are becoming increasingly more complex in nature and, with this increased complexity; CTI continues to strive to provide first class solutions for our sponsors.

During 2009, we completed our validation and installation of Oracle's Siebel Clinical Trial Management System.

This state-of-the-art CRM application replaces our previous internally developed CTMS product, and provides our sponsors users around the world with a centralized trial management database with the most relevant and appropriate information, based on specific roles and responsibilities. Siebel CTMS collects, tracks and analyzes various clinical trial information, thereby providing users with the greatest opportunity to run their clinical trials successfully. The application provides real-time study milestone and subject enrollment tracking which helps users identify enrollment bottlenecks earlier in the process, allowing them to be addressed more promptly, preserving study timelines. This CTMS solution also affords our Study Managers the needed automated tools to help manage all study and regulatory documents, closely monitor site performance to minimize costly protocol violations, actively maintain contacts with their sites, schedule site visits, create and submit visit reports, and ensure that timely and accurate payments are made.

This CTMS solution rounds out CTI's Oracle clinical trial platform of products that we offer our sponsors, as we have previously validated and installed Oracle Clinical, Oracle Remote Data Capture, and Oracle's Adverse Event Reporting System.
